

The beauty of burning bracken.

High calorific value – burns hotter and longer than oak

Low moisture content – you're not buying water

Residue high in potash – ashes make a natural fertilizer ideal for gardens

A suffocating nuisance plant – cutting regularly increases biodiversity

Encourages the growth of flora and fauna – like bluebells

Grows on heath & moorland – valuable arable land isn't taken out of food production

The real beauty – we're not cutting down any trees in order to keep the home fires burning

Winners of the South West Green Energy Awards 2016

How to get the best out of your beautiful Brackettes.

1. Please store your bags of Brackettes in a dry place. Once opened keep indoors.
2. To light the Brackettes it is essential to create a good hot bed. Use a firelighter or rolls of paper and plenty of kindling. Allow the kindling to blaze before putting on Brackettes.
3. Place two Brackettes on the blazing kindling making sure you have a good supply of air. Ensure the Brackettes are fully alight before restricting air vents.
4. When introducing more Brackettes open up vents and keep a positive air flow until the new log is flaming.
5. Our Brackettes produce more ash than logs, but the residue is high in potash – so it can be put straight onto the garden as a fertilizer.
6. Empty the ash tray regularly to avoid any build-up.

Thank you for buying our eco-friendly, biomass Brackettes and in doing so contributing to a greener environment. For more information look on our website.
